Dear Hiring Manager, my name is Daniil Pechenkin, and I am a fourth-year student of Omsk State University of Railway Transport.

I was taught a lot at the university, and my last year and my thesis are waiting for me. And I understand that I have a lot to grow, that I have many prospects for development in the IT field, whether it's software development, data analysis, embedded systems programming, security and much more.

I can say about myself that I really like to understand algorithms of various kinds, and in the field of IT, algorithms are one of the most important areas, one can say the basic, connecting many other areas. I also really like to understand the operation of operating systems, of course, I study linux-like systems more deeply. Now I am actively using a distribution based on Arch – linux Manjaro. And, of course, where without a programming language? I am actively exploring the possibilities of the Python language. Indeed, this programming language opens up a lot of possibilities for me.

I am very interested in taking a summer internship with you, as this is a great way to expand the horizons of my professional competencies, travel a little and discover excellent employment opportunities. I look forward to the internship for new knowledge and employment prospects, as well as immersion in a new team of scientifically oriented people!

I study in the specialty Information security of automated systems, and I like what I do! I think that a security specialist should be a good programmer and no less a good system administrator, this is a kind of synergy. In me, these two qualities are successfully combined.

I study at the university with excellent grades – an average score of 4.77/5.

I soberly assess my capabilities and am confident that I can benefit the people around me, no matter where I am.

Thanks for your attention!
